IN THE CLAIMS

Please amend the claims as follows:

- 1. (original) A high frequency driver for a gas discharge lamp, which is in series with an inductor and which has a capacitor connected in parallel to it, comprising an oscillator, which has DC input terminals for connecting to a DC source and AC output terminals for connecting to a load comprising the lamp, the inductor and the capacitor, the oscillator oscillating at a first high frequency during ignition of the lamp and the oscillator oscillating at a second high frequency during normal operation of the lamp after its ignition, with the first frequency being higher than the second frequency by a ratio of at least 2,2.
- 2. (original) The driver according to claim 1, wherein, the ratio is in a range of 2,2 to 7.
- 3. (original) The driver according to claim 1, wherein, the ratio is about 5.
- 4. (original) The driver according to claim 1, wherein, the oscillating frequency is frequency modulated with less than 15% of an average of the oscillating frequency.

- 5. (original) The driver according to claim 4, wherein, the frequency modulation is about 7% of the average of the oscillating frequency.
- 6. (original) The driver according to claim 4, wherein, the modulating frequency is derived from an AC supply to the DC source.
- 7. (original) A method for driving a gas discharge lamp, which is in series with an inductor and which has a capacitor connected in parallel to it, by a driver which comprises an oscillator, which has DC input terminals for connecting to a DC source and AC output terminals for connecting to a load comprising the lamp, the inductor and the capacitor, the oscillator oscillating at a first high frequency during ignition of the lamp and the oscillator oscillating at a second high frequency during normal operation of the lamp after its ignition, with the first frequency being higher than the second frequency by a ratio of at least 2,2.
- 8. (original) The method according to claim 7, wherein, the ratio is in a range of 2,2 to 7.

- 9. (original) The method according to claim 7, wherein, the ratio is about 5.
- 10. (original) The method according to claim 7, wherein, the oscillating frequency is frequency modulated with less than 15% of an average of the oscillating frequency.
- 11. (original) The method according to claim 10, wherein, the frequency modulation is about 7% of the average of the oscillating frequency.
- 12. (original) The method according to claim 10, wherein, the modulating frequency is derived from an AC supply to the DC source.
- 13. (currently amended) A Gas discharge lamp assembly comprising a gas discharge lamp, an inductor which is in series with the lamp, and a capacitor which is in parallel to the lamp, a DC supply circuit and a driver according to one of the claims 1 to 6 claim 1 which is connected in series between the DC supply circuit and the lamp.
